# **Overview**

- Introduction
- Cloud Architecture
- Infrastructure as a Service

# **Terminology**

- Cloud computing
- \*aaS
- DevOps
- Cloud Native, Microservices
- Serverless

Lecture 2: Cloud Architectures, CTU Summer Semester 2020/2021, @m1ci

-3-

## What is a Cloud?

- A different way of thinking
  - Got your grand mum's savings under your pillow?
    - → probably not, you better have them in your bank
  - Data is your major asset
  - you better have them in a "bank" too
  - Someone can abuse your data?
  - − banks bankrupt too, sometimes − it is a risk you take
  - there is a market and a competition
- Outsourcing of application infrastructure
  - Reliability and availability
  - Low costs pay-per-use
  - Elasticity can dynamically grow with your apps

Lecture 2: Cloud Architectures, CTU Summer Semester 2020/2021, @m1ci

-4-

#### What is a Cloud?

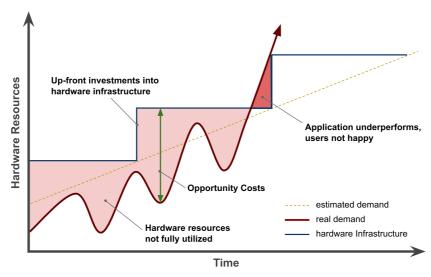

- Any app you access over the web?
- A datacenter?
  - Offers virtualization
  - Any company having a datacenter wants to move to
- Cloud provider should also offer services, such as:
  - scalability, storage
  - Possible to configure programmatically
    - → integration to enterprise administration processes
    - $\rightarrow$  usually REST interface

Lecture 2: Cloud Architectures, CTU Summer Semester 2020/2021, @m1ci

- 5 -

# **Traditional Solution to Infrastructure**

- Traditional hardware model
  - *Up-front hardware investments*
  - Hardware not optimally utilized

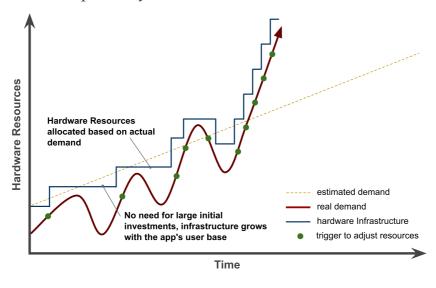

Lecture 2: Cloud Architectures, CTU Summer Semester 2020/2021, @m1ci

- 6 -

# **Good Performance – Cloud Solution**

# • Cloud Computing model

- No up-front hardware investments
- Hardware optimally utilized

Lecture 2: Cloud Architectures, CTU Summer Semester 2020/2021, @m1ci

- 7 -

# **Cloud Computing Concepts**

## • Resource Pooling

- Resources reused by multiple tenants (multitenancy)
- Resources: CPU, memory, storage, network

#### • On-demand and Self-service

- Resources are provisioned as they are requested and when they are required
- No human interaction, automatic

### • Scalability and Elasticity

- Infrastructure may grow and shrink according to needs
- Automatic or manual

## • Pay-per-use

- Consumers only pay for resources when they use them

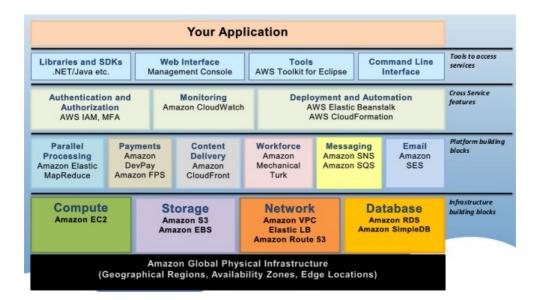

# **Cloud Computing Concepts (Cont.)**

- Service Models (aka Cloud Layers)
  - IaaS Infrastructure as a Service
  - PaaS Platform as a Service, Serverless
    - $\rightarrow$  MWaaS, DBaaS, ...
    - $\rightarrow$  FaaS
  - SaaS Software as a Service
- Deployment Models
  - Public Cloud
  - Private Cloud
  - Hybrid Cloud

Lecture 2: Cloud Architectures, CTU Summer Semester 2020/2021, @m1ci

- 9 -

# **Cloud Provider Example – Amazon AWS**

Lecture 2: Cloud Architectures, CTU Summer Semester 2020/2021, @m1ci

- 10 -

## **Overview**

- Introduction
- Cloud Architecture
  - Service Models
  - Multitenancy
- Infrastructure as a Service

Lecture 2: Cloud Architectures, CTU Summer Semester 2020/2021, @m1ci

<del>- 11 -</del>

## IaaS: Infrastructure as a Service

- Provides basic computing resources and services for application providers
  - Services for application providers
  - A consumer is able to deploy and run arbitrary software
- Infrastructure implications
  - $\ Exposing \ of \ infrastructure \ resources \ through \ abstraction$
  - Support for infrastructure resources compute (hardware/OS/VM), storage, network, etc.
  - Supports isolation for multitenant environments

### IaaS: Infrastructure as a Service

#### Usage

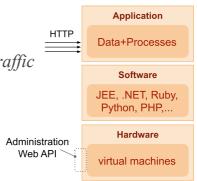

- Predefined machine instances (micro, small, large, extra-large)
  - → Linux OS, 613 MB of memory, 30 GB of Storage, Load Balancer, etc.
- Pay-per-use pay for resources you use (time or amount); no up-front costs

### • IaaS Services Examples

- Elastic Storage
- Monitoring resources
  - → Amazon CloudWatch)
- Auto Scalling of running instances
- Load Balancing distributing incoming traffic across multiple instances

# • IaaS providers

- Amazon EC2, GoGrid, Rackspace, OpenNebula, Oracle OCI, ...

Server

Lecture 2: Cloud Architectures, CTU Summer Semester 2020/2021, @m1ci

- 13 -

### PaaS: Platform as a Service

## • Provides scalable platform for applications

- Services for application providers
- No costs of buying and managing underlying infrastructure
  - $\rightarrow$  hardware and software

### • Infrastructure implications

- Scalable platform, deploy on-demand
- Self service interface to deploy applications and services
- Support for monitoring and measuring platform usage
- Model supporting isolation in multi-tenant environments

### PaaS: Platform as a Service

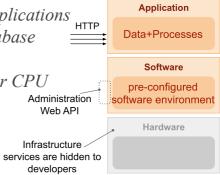

- Usage
  - Choose software platform, e.g., JEE, .NET, Python, etc.
  - Pay-per-use pay for the resources you use; no up-front costs

#### PaaS features

- Auto Scalling and Load Balancing of applications
- Persistent Storage usually NoSQL database
- Local development environment
- Backends for app instances with higher CPU
   and memory demands
- Administration APIs for its services

#### PaaS providers

- Google App Engine, Heroku, Windows Azure, etc.

Server

Lecture 2: Cloud Architectures, CTU Summer Semester 2020/2021, @m1ci

**- 15 -**

### SaaS: Software as a Service

- Software delivery model for applications hosted in the cloud
  - typically software for end-users
  - services accessed using a web browser
  - provides API for programmatic access

#### SaaS characteristics

- Typically build on top of IaaS or PaaS
- Configurable and customizable modern Web applications
- Usually basic version for free, need to pay for pro version
- Global availability any computer, any device
- Easy management automatic and fast updates
- Pay-per-use pay for the time you use

### • SaaS providers

- Google Apps, Salesforce, iCloud, Flickr, Picasa, ...

## **Overview**

- Introduction
- Cloud Architecture
  - Service Models
  - Multitenancy
- Infrastructure as a Service

Lecture 2: Cloud Architectures, CTU Summer Semester 2020/2021, @m1ci

- 17 -

# **Multitenancy**

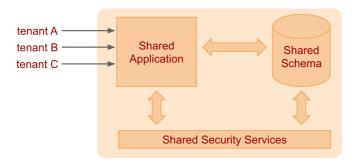

- Architectural approach where resources are shared between multiple tenants or consumers
- Implications
  - Centralization of infrastructure in locations with lower costs
  - Peak-load capacity increases
  - Utilisation and efficiency improvements for systems that are not well utilised
- Sharing options
  - Shared Everything
  - Shared Infrastructure
    - → Virtual Machines
    - → OS "virtualization"

Lecture 2: Cloud Architectures, CTU Summer Semester 2020/2021, @m1ci

**- 18 -**

# **Shared Everything**

- Resources are shared between all tenants or consumers
  - tenant: a service consumer
- Common for the SaaS model
- The application should provide tenant isolation
- Data for multiple tenants is stored in the same database tables

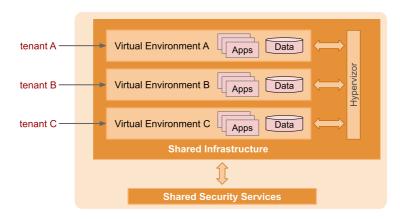

Lecture 2: Cloud Architectures, CTU Summer Semester 2020/2021, @m1ci

**- 19 -**

## **Shared Infrastructure: Virtual Machines**

- Infrastructure shared via virtual machines
  - each tenant has its own virtual environment
  - Isolation provided by hypervisor
    - → hypervisor: virtual machine manager, runs virtual machines
  - Resource contention depends on VM capability and configuration
  - Adds an additional layer and processes to run and manage

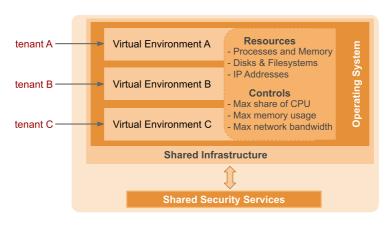

Lecture 2: Cloud Architectures, CTU Summer Semester 2020/2021, @m1ci

**- 20 -**

## **Shared Infrastructure: OS Virtualization**

- Infrastructure shared via OS Virtualization
  - Each tenant has its own processing zone
  - Isolation provided by the operating system
  - Resource contention depends on zone configuration
  - No VMs to run and manage, no abstraction layer between app & OS

Lecture 2: Cloud Architectures, CTU Summer Semester 2020/2021, @m1ci

- 21 -

## **Overview**

- Introduction
- Cloud Architecture
- Infrastructure as a Service
  - Infrastructure as Code

Lecture 2: Cloud Architectures, CTU Summer Semester 2020/2021, @m1ci

- 22 -

# Terminology (1)

- Region
  - A localized geographical area
  - A cloud provider usually has multiple regions around the world.
- Availability Domain
  - A datacenter in a region; there can be more AD in a region
- Tenancy
  - Isolated partition where a customer creates and organizes cloud resources.
- Instance
  - Compute host running in the cloud
- Bare Metal
  - Physical host that run directly on bare metal servers without hypervisor
- Shape/Class
  - Amount of computing resources allocated to the instance
  - CPUs, Memory, Local Disk, Network Bandwidth, Number of VNICs
- Image
  - A template of a virtual hard drive that defines operating system and other software for an instance.

Lecture 2: Cloud Architectures, CTU Summer Semester 2020/2021, @m1ci

- 23 -

# Terminology (2)

- Instance Pool
  - A group of instances
- Virtual Cloud Network (VCN)
  - A virtual network in which instances run
  - It includes: subnets, route tables, firewall rules, gateways
- Block Volume
  - A virtual disk providing persistent storage
  - It can be used as a volume attached to the instance
- Object Storage
  - Allows to store and manage data as objects in logical containers (buckets)
  - The data can be of any type and are usually of large size
  - The data does not change frequently
  - Examples: data backup, storing unstructured data, sensor-generated data

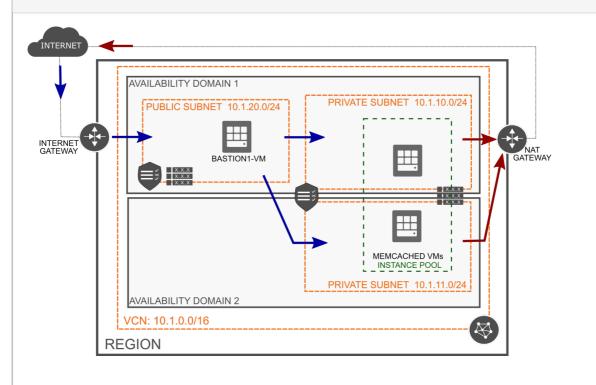

# **Access and Usage**

- Layers
  - Cloud Infrastructure  $\rightarrow$  REST API  $\rightarrow$  CLI, Web Console, other tools
- Key pair
  - Authentication mechanism using **public** and **private** key
  - public key is uploaded to an instance, a client uses the private key to authenticate
  - Example: ssh using key authentication to access ssh deamon running in Linux

Lecture 2: Cloud Architectures, CTU Summer Semester 2020/2021, @m1ci

- 25 -

# IaaS Example

Lecture 2: Cloud Architectures, CTU Summer Semester 2020/2021, @m1ci

**- 26 -**

## **Overview**

- Introduction
- Cloud Architecture
- Infrastructure as a Service
  - Infrastructure as Code

Lecture 2: Cloud Architectures, CTU Summer Semester 2020/2021, @m1ci

- 27 -

## **Overview**

- Definition
  - Application envs (in a cloud) managed via definition files
  - Version control, team development, scripting, etc.
- Major Technologies
  - Configuration Management Tools
    - ightarrow install and manage software on machines that already exist
    - $\rightarrow$  Examples: Ansible, Chef, Puppet
  - $Abstraction\ of\ cloud\ infrastructure$ 
    - $\rightarrow \textit{Terraform}$

Lecture 2: Cloud Architectures, CTU Summer Semester 2020/2021, @m1ci

**- 28 -**

## **Terraform**

- Higher-level abstraction of the datacenter and associated services
- Supports many service providers
  - Google, Microsoft, Oracle, AWS
- Steps
  - 1. Description of resources in Hashicorp Configuration Language (HCL)
    - instances, networks, firewall rules, routing tables, etc.
  - 2. Terraform generates execution plan to reach the desired state
  - 3. Terraform executes the plan to reach the desired state; can generate incremental execution plan

Lecture 2: Cloud Architectures, CTU Summer Semester 2020/2021, @m1ci

- 29 -
